

# Straight Teeth Six Months Frequently Asked Questions

## **How can I get straighter teeth in just 6 months?**

The first thing I tell patients about Straight Teeth 6 Months braces is that we use exact, scientific dental analysis to determine the most beautiful position for your teeth. The materials and methods we use in Straight Teeth 6 Months braces have been around for over 75 years. The 6 months braces have been improved by modern technologies to move your teeth quickly and safely.

One of the technologies that have improved the most is the use of the high-tech arch-wires. The shape memory of these wires allows us to move your teeth continuously without interruption. The continuous light force applied to your teeth moves your teeth to the most desired location in the fastest possible time. Straight Teeth 6 Months braces uses long standing proven dental principles and the benefits of modern technology, to predictably give you a great smile.

## **How does it feel to wear Straight Teeth 6 Months braces?**

Patients of all ages wear braces with little impact on their everyday lives. The individual parts of the braces have been reduced greatly in size and are mostly bonded directly to your teeth. Once the braces are placed, the patient usually adjusts to wearing them and eating with them very quickly. The forces on the teeth are always light and comfort aids are available until your mouth adjusts to the new sensation of orthodontic treatment.

## **Could this type of treatment cause any damage to my teeth?**

It is similar to traditional orthodontics and any other dental procedure. The risks of damaging your teeth are well known and easily managed. Since the forces used on the Straight Teeth 6 Months braces are lighter and the teeth are seldom extracted, there are actually fewer risks involved with this technique.

## **Straight Teeth 6 Months braces sounds good but, will I have a mouth full of metal braces?**

No, Straight Teeth 6 Months braces uses clear, barely visible adult braces to gently straighten your teeth. We can also offer lingual braces with Straight Teeth 6 Months braces that are placed behind your teeth so they can be completely hidden from view.

## **How is the Straight Teeth 6 Months braces different from traditional braces?**

The Straight Teeth 6 Months braces focuses on moving your front top and front bottom teeth, the teeth that are shown when you smile. These are known as the anterior teeth. Unlike traditional braces, the Straight Teeth 6 Months braces is not for people that have trouble chewing or need major bite realignment, but simply for people that want to straighten the appearance of their teeth. Teeth that are crowded, rotated, or overlapping can be moved to a more desired position, and teeth with gaps and spaces can be brought together to improve the appearance of the smile.

## **Will it be necessary for me to wear retainers?**

Yes, as with any teeth straightening technique, a retainer is necessary once the treatment is complete. We use a fixed retainer that gives you the peace of mind of knowing that your teeth will stay in their most beautiful new positions. According to your personal preference and situation, there are a variety of options available including a completely clear retainer that you can use.
